Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Ibuprofen Oral Suspension is a suspension of Ibuprofen in a suitable flavoured vehicle.

*The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.*

Content of ibuprofen, C₁₃H₁₈O₂

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the oral suspension containing 0.5 g of Ibuprofen with 25 mL of *dichloromethane* and 15 mL of *water*. Allow to stand until the layers have separated and discard the upper layer. Shake the lower layer with 5 mL of *water* and discard the upper layer. Evaporate the lower layer to dryness, add 20 mL of *water* to the residue and filter (Whatman GF/C filter is suitable). Wash the residue with 20 mL of *dichloromethane* and evaporate to dryness. The *infrared absorption spectrum* of the residue, *Appendix II A*, is concordant with the *reference spectrum* of ibuprofen *(RS 186)*.

TESTS
Acidity

pH, 3.6 to 4.6, Appendix V L.

Dissolution

Comply with the dissolution test for tablets and capsules, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.
(b) Use 900 mL of phosphate buffer pH 7.2, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for liquid chromatography, Appendix II D, using the following solutions.

(1) Shake the oral suspension for 30 seconds and place a volume of the oral suspension containing 0.2 g of Ibuprofen into each dissolution vessel. After 30 minutes, withdraw a sample of the medium, filter and dilute, if necessary, with the dissolution medium to produce a solution expected to contain 0.022% w/v of Ibuprofen.
(2) 0.022% w/v of ibuprofen BPCRS in the dissolution medium.
(3) 0.03% w/v each of benzophenone and ibuprofen BPCRS in the dissolution medium.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with octylsilyl silica gel for chromatography (5 µm).
(b) Use isocratic elution and the mobile phase described below.
(c) Use a flow rate of 2 mL per minute.
(d) Use an ambient column temperature.
(e) Use a detection wavelength of 220 nm.
(f) Inject 10 µL of each solution.

MOBILE PHASE

37 volumes of acetonitrile and 63 volumes of 0.01M orthophosphoric acid.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the resolution between the two principal peaks is at least 1.5.

DETERMINATION OF CONTENT

Calculate the total content of ibuprofen, C_{13}H_{18}O_{2}, in the medium using the declared content of C_{13}H_{18}O_{2} in ibuprofen BPCRS.

LIMITS

The amount of ibuprofen released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for liquid chromatography, Appendix III D, using the following solutions immediately after preparation.
(1) Disperse with the aid of ultrasound a quantity of the oral suspension containing 0.2 g of ibuprofen in 20 mL of acetonitrile R1. Add sufficient mobile phase A to produce 100 mL and filter (Whatman GF/C is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with mobile phase A. Further dilute 1 volume to 10 volumes with mobile phase A.

(3) Dissolve 20 mg of ibuprofen BPCRS in 2 mL of acetonitrile R1, add 1 mL of a 0.006% w/v solution of ibuprofen impurity B BPCRS in acetonitrile R1, and dilute to 10 mL with mobile phase A.

(4) 0.0006% w/v of 4'-isobutylacetophenone BPCRS (impurity E) in mobile phase A.

(5) Dissolve the contents of a vial of ibuprofen for peak identification EPCRS in 1 mL of acetonitrile R1, and dilute to 5 mL with mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with end-capped octadecylsilyl amorphous organosilica polymer for chromatography (5 µm) (XTerra MS C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 214 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 0.5 volume of orthophosphoric acid, 340 volumes of acetonitrile R1, and sufficient water to produce 1000 volumes.

Mobile phase B acetonitrile R1.

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to ibuprofen (retention time about 26 minutes) are: impurity J, about 0.2; impurity N, about 0.3; impurity A, about 0.9; impurity B, about 1.08; and impurity E, about 1.11

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the peak-to-valley ratio is at least 5.0, where Hp is the height above the baseline of the peak due to ibuprofen and Hv is the height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity B.

LIMITS
Use the chromatogram supplied with ibuprofen for peak identification EPCRS and the chromatogram obtained with solution (5) to identify the peaks due to impurities A, J, and N, and the chromatogram obtained with solution (4) to identify the peaks due to impurity E.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A, J or N, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.15% of each);

the area of any peak corresponding to impurity E is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the area of any other secondary peak is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%);

the sum of the areas of any secondary peaks is not greater than 7 times the area of the principal peak in the chromatogram obtained with solution (2) (0.7%).

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Carry out the method for liquid chromatography, Appendix III D, using the following solutions immediately after preparation.

(1) Mix a weighed quantity of the oral suspension containing 0.1 g of Ibuprofen with 30 mL of acetonitrile, add a further 10 mL of acetonitrile and 10 mL of 0.01M orthophosphoric acid, shake vigorously, dilute to 100 mL with 0.01M orthophosphoric acid and filter (Whatman GF/C paper is suitable).

(2) 0.1% w/v of ibuprofen BPCRS prepared by dissolving a suitable quantity in 40 volumes of acetonitrile and adding 60 volumes of 0.01M orthophosphoric acid.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with end-capped octadecylsilyl silica gel for chromatography (10 μm) (µBondapak C18 is suitable).
(b) Use isocratic elution and the mobile phase described below.
(c) Use a flow rate of 2 mL per minute.
(d) Use an ambient column temperature.
(e) Use a detection wavelength of 220 nm.
(f) Inject 10 μL of each solution.

MOBILE PHASE

400 volumes of acetonitrile and 600 volumes of 0.01M orthophosphoric acid.

DETERMINATION OF CONTENT

Determine the weight per mL of the oral suspension, Appendix V G, and calculate the content of C₁₃H₁₈O₂, weight in volume, from the declared content of C₁₃H₁₈O₂ in ibuprofen BPCRS.
STORAGE

Ibuprofen Oral Suspension should be protected from light.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Ibuprofen.
